Introduction: Integrative Analysis

- Analyzing data from individual study
 - → small sample size
 - → does not account for study heterogeneity
 - → inconsistent results due to the technical variability.
- Developing Integrative analysis from multiple studies
 - ightarrow address the potential biases
 - → boost statistical power and recover signals

Figure: Integrative analysis leveraging information from multiple studies

Introduction: Alpha diversity

- Alpha diversity: summarizes the diversity within an ecological community
 - Species Richness: how many?
 - Species Evenness: how different?

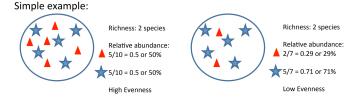

Figure: A toy example of species richness and evenness ³

Runzhe Li (JHU) ENAR 2020

Methods: Two-Stage Kernel Machine Regression Model

Stage One

The association between alpha-diversity and HIV status via a linear mixed model

$$y_{ij} = x_{ij}\beta_i + z_{ij}^{\top}\gamma + h_i + \epsilon_{ij}$$

$$Y_{N\times 1} = X_{N\times p}\beta_{p\times 1} + Z_{N\times q}\gamma_{q\times 1} + h_{N\times 1} + \epsilon_{N\times 1}$$

where $\beta(p \times 1), \gamma(q \times 1)$ are regression coefficients for fixed effects. $h_i \sim N(0, \sigma_h^2)$ are study-specific random effect which captures the difference between studies, $\epsilon_{ij} \sim N(0, \sigma_e^2)$ are error terms.

◆ロト ◆個ト ◆園ト ◆園ト ■ めので

Runzhe Li (JHU) ENAR 2020 March 23, 2020 10 / 31

Methods: Two-Stage Kernel Machine Regression Model

Stage Two

We allow β_i to vary according to the study-specific characteristics

$$\beta_i = \beta_0 + f(G_i)$$

where $f(\cdot)$ is a function in reproducing kernel Hilbert space generated by a positive semidefinite kernel function $K(\cdot,\cdot)$. For example, a linear kernel $K(G_i,G_{i'})=\sum_{j=1}^r G_{ij}G_{i'j}$ could measure the similarity between study i and study i'.

 □ → < □ →

Runzhe Li (JHU) ENAR 2020 March 23, 2020 11/31

Consider a special case where the second stage is:

$$\beta = \beta_0 \cdot \mathbf{1_p} + G\alpha, \alpha \sim N(0, \tau^2 I_{r \times r})$$

where $\beta \sim N(\beta_0 \cdot \mathbf{1_p}, \tau^2 K)$ and K = GG'.

Runzhe Li (JHU) ENAR 2020 March 23, 2020 12 / 31

Plug in and we can derive:

$$Y = (X1_p\beta_0 + Z\gamma) + (XG\alpha + h) + \epsilon$$
$$\alpha \sim N(0, \tau^2 I)$$

We are interested in the following hypothesis testings.

- (test for common effect) test $\beta_0 = 0$ under $\tau^2 = 0$
- (test for heterogeneity) test $\tau^2 = 0$ under $\beta_0 = 0$
- (test for heterogeneity) test $au^2=0$ without constraint on eta_0
- (joint test) combine test 1 and 3
- § (test for common effect) test $\beta_0=0$ without constraint on au

- 4 ロ ト 4 個 ト 4 差 ト 4 差 ト . 差 . か Q (C)

13 / 31

Runzhe Li (JHU) ENAR 2020 March 23, 2020

1. (Burden test) test $\beta_0 = 0$ under $\tau^2 = 0$

$$Q_{\beta_0} = (Y - Z\hat{\gamma})^{\top} \hat{\Sigma_0}^{-1} X \mathbf{1}_p \mathbf{1}_p^{\top} X^{\top} \hat{\Sigma_0}^{-1} (Y - Z\hat{\gamma})$$

where the null MLE: $\hat{\gamma}, \hat{\sigma_h^2}, \hat{\sigma_e^2}$, and estimated null covariance matrix:

$$\hat{\Sigma_0} = \hat{\sigma_h^2} H + \hat{\sigma_e^2} I_N$$
 could be derived under the null model $Y = Z\gamma + h + \epsilon$.

We can further show that Q_{β_0} follows a scaled chi-square distribution with freedom 1.

14 / 31

Runzhe Li (JHU) ENAR 2020 March 23, 2020

2. (SKAT test) test
$$\tau^2 = 0$$
 under $\beta_0 = 0$

$$Q_{\tau_0^2} = (y - Z\hat{\gamma})^{\top} \hat{\Sigma_0}^{-1} X K X^{\top} \hat{\Sigma_0}^{-1} (Y - Z\hat{\gamma})$$

where $\hat{\gamma}$ and $\hat{\Sigma_0}$ are still derived under the null model $Y = Z\gamma + h + \epsilon$.

According to Davies method ⁴, Q_{τ^2} follows a mixture of chi-square distribution.

Runzhe Li (JHU) ENAR 2020 March 23, 2020 15 / 31

⁴ Davies, R. B. (1980). The distribution of a linear combination of χ^2 random variables. Journal of the Royal Statistical Society: Series C (Applied Statistics), 29(3), 323-333.

3. (Unconstrained SKAT test) test $au^2=0$ without constraint on eta_0

$$Q_{ au^2} = (y - \hat{\mu})^ op \hat{\Sigma}^{-1} X K X^ op \hat{\Sigma}^{-1} (y - \hat{\mu})$$

Let $\hat{\mu}$ denote the fitted value, $\hat{\Sigma}$ be the estimated covariance matrix under the model $Y = X \mathbf{1}_p \beta_0 + Z \gamma + \epsilon$.

Similarly, we could also show Q_{τ^2} follows a mixture of chi-square distribution.

16/31

Runzhe Li (JHU) ENAR 2020 March 23, 2020

4. (Optimal Joint Test) test $\beta_0 = 0$ and $\tau^2 = 0$

Let $Q_{\rho}=\rho Q_{\beta_0}+(1-\rho)Q_{\tau^2}$, where Q_{β_0} is derived from burden test, and Q_{τ^2} is derived from unconstrained SKAT test. Let p_{ρ} denote the p-value of Q_{ρ} . Then the test statistics is

$$T = \min_{0 \le \rho \le 1} p_{\rho}$$

◆ロト ◆個ト ◆差ト ◆差ト 差 める()

Runzhe Li (JHU) ENAR 2020 March 23, 2020 17/31

5. (Unconstrained burden test) test $\beta_0=0$ without constraint on au

$$Q_{\beta} = (Y - Z\hat{\gamma})^{\top} \hat{\Sigma}_{\tau}^{-1} X \mathbf{1}_{p} \mathbf{1}_{p}^{\top} X^{\top} \hat{\Sigma}_{\tau}^{-1} (Y - Z\hat{\gamma})$$

where $\hat{\Sigma}_{\tau} = \hat{\sigma}_{h}^{2}H + \hat{\sigma}_{e}^{2}I_{N} + \hat{\tau}^{2}XKX^{\top}$ could be derived from the model $Y = Z\gamma + XG\alpha + h + \epsilon$.

 Q_{β} follows a scaled chi-square distribution with freedom 1.

 $^{^\}dagger$ the default p-value of linear mixed model only testing for common effect in R.

Power

Case I :
$$\beta_0=0.1$$
 and $au=0$

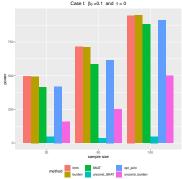

Figure: Power under simulation setting 1

Findings

- sample size increases → power increases
- overall performance: LMM,
 burden > optimal joint test >
 SKAT
- unconstrained SKAT test has power ≈ type I error

Runzhe Li (JHU) ENAR 2020 March 23, 2020 23 / 31

Power

Case II :
$$\beta_0=0$$
 and $au=0.1$

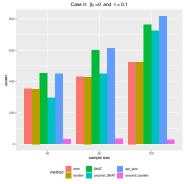

Figure: Power under simulation setting 2

Findings

- overall performance: optimal joint test, SKAT > unconstrained SKAT > LMM, burden
- unconstrained burden test has power \approx type I error

Runzhe Li (JHU) ENAR 2020 March 23, 2020 24 / 31

Power

Case III :
$$\beta_0=0.1$$
 and $au=0.1$

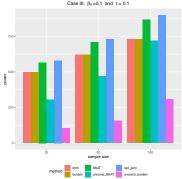

Figure: Power under simulation setting 3

Findings

 overall performance: optimal joint test is the most powerful test compared to other burden and variance component test.

Summary

Conclusions

- propose a two-stage kernel machine regression model to associate alpha diversity with the phenotype of interests.
 - Stage one: model the relationship between the alpha diversity and the phenotype via a linear mixed model.
 - Stage two: incorporate the study-specific characteristics through a nonparametric function to allow for the between-study heterogeneity.
- construct several association testing problems.
- design the simulation studies.

Future work

- permutation tests for small sample size adjustment.
- application on real HIV studies.
